# 3-to-8 line decoder/demultiplexer with address latches

## **74HC/HCT237**

#### **FEATURES**

- Combines 3-to-8 decoder with 3-bit latch
- Multiple input enable for easy expansion or independent controls
- · Active HIGH mutually exclusive outputs
- · Output capability: standard
- I<sub>CC</sub> category: MSI

#### **GENERAL DESCRIPTION**

The 74HC/HCT237 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT237 are 3-to-8 line decoder/demultiplexers with latches at the three address inputs (A<sub>n</sub>). The "237" essentially combines the 3-to-8 decoder function with a 3-bit storage latch. When the latch is enabled ( $\overline{\text{LE}}$  = LOW), the "237" acts as a 3-to-8 active LOW decoder. When the latch enable ( $\overline{\text{LE}}$ ) goes from LOW-to-HIGH, the last data present at the inputs before this transition, is stored in the latches. Further address changes are ignored as long as  $\overline{\text{LE}}$  remains HIGH.

The output enable input ( $\overline{E}_1$  and  $E_2$ ) controls the state of the outputs independent of the address inputs or latch operation. All outputs are HIGH unless  $\overline{E}_1$  is LOW and  $E_2$  is HIGH.

The "237" is ideally suited for implementing non-overlapping decoders in 3-state systems and strobed (stored address) applications in bus oriented systems.

#### **QUICK REFERENCE DATA**

 $GND = 0 \text{ V}; T_{amb} = 25 \, ^{\circ}\text{C}; t_r = t_f = 6 \text{ ns}$ 

SYMBOL	DADAMETED	CONDITIONS	TYP	LINUT	
	PARAMETER	CONDITIONS	НС	нст	UNIT
t <sub>PHL</sub> / t <sub>PLH</sub>	propagation delay	C <sub>L</sub> = 15 pF; V <sub>CC</sub> = 5 V			
	$A_n$ to $Y_n$		16	19	ns
	LE to Y <sub>n</sub>		19	21	ns
	$\overline{E}_1$ to $Y_n$		14	17	ns
	E <sub>2</sub> to Y <sub>n</sub>		14	17	ns
C <sub>I</sub>	input capacitance		3.5	3.5	pF
C <sub>PD</sub>	power dissipation capacitance per package	notes 1 and 2	60	63	pF

### Notes

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu W$ ):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_1 \times V_{CC}^2 \times f_o)$$
 where:

f<sub>i</sub> = input frequency in MHz

f<sub>o</sub> = output frequency in MHz

 $\sum (C_L \times V_{CC}^2 \times f_0) = \text{sum of outputs}$ 

C<sub>L</sub> = output load capacitance in pF

V<sub>CC</sub> = supply voltage in V

2. For HC the condition is  $V_I = GND$  to  $V_{CC}$ For HCT the condition is  $V_I = GND$  to  $V_{CC} - 1.5$  V

### DC CHARACTERISTICS FOR 74HCT

For the DC characteristics see "74HC/HCT/HCU/HCMOS Logic Family Specifications".

Output capability: standard

I<sub>CC</sub> category: MSI

## Note to HCT types

The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for a unit load of 1 is given in the family specifications. To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
A <sub>n</sub>	1.50
E <sub>1</sub>	1.50
E <sub>2</sub>	1.50
ĪĒ	1.50
